If I am using isKindOfClass for getter and setter, should it be used to prevent client from getting or setting properties? A: The iPhone developer center states that The [GetType] and [SetType] methods are useful when you want to retrieve or store the class or subclass type of an object and be notified as to what methods or properties are defined for that class or subclass. and also The [IsKindOf] and [IsMember] methods are useful when you want to determine whether an object is the same class or subclass that is defined in a different program module (such as Objective-C class structure or C++ virtual inheritance) These methods may be used in debugging - it is unlikely that they would be used accidentally. In general, I would assume that you should be able to call methods that are declared in the class being tested. Any time that you use private or internal methods or properties, you are probably being forced to do something that is wrong or violates some rule. If you can't call the method, then there is probably a reason. Cocoa and Cocoa Touch are almost entirely composed of classes and protocols. You would generally not be testing the implementation of any particular methods or properties. If you did, then you would want the methods and properties to be public. Q: How to set breakpoints during debugging in windows phone 7 emulator? Is there a way to set breakpoints in Visual Studio 2010 for debugging windows phone 7 apps using the emulator? Currently, the only option I have to step into the code is the "F11" key. A: Yes, you can. From: XAMLDevTool.WPF.Breakpoints.xaml:
